CMPT 340 - D100 Biomedical Computing

Instructor(s): Ghassan Hamarneh

Calendar Objective/Description:
Biomedical Computing

Instructor's Objectives:
Biomedical computing is a rapidly emerging area that is revolutionizing medicine and biology. It focuses on the use of computational and mathematical techniques to accelerate scientific discovery and to improve diagnosis, treatment, and understanding of diseases. The general objectives of the course are: To give the student breadth in the topics related to the use of computers in biology, medicine, and healthcare, in both theory and application. To enable the student to converse knowledgeably with radiologists, physicians, and MDs about these topics and related technologies. To learn the technical basis of many aspects of the use of technology in biomedicine (e.g. data acquisition, biosignal/image processing and visualization, feature representation and extraction, data interpretation and machine learning), current and future trends, and their benefits and limitations.

Prerequisites:
see go.sfu.ca

Topics:
- Biosignals and signal analysis: The properties of different types of biosignals (e.g. EEG and ECG) and the techniques used for processing and analysis of biosignals (e.g. frequency domain filtering).
- Medical imaging and image processing: The acquisition of different medical images (e.g. magnetic resonance imaging and X-ray computed tomography) and the techniques used for processing, analysis, and visualization of medical images (e.g. image segmentation and registration).
- Medical knowledge and decision support: The representation of medical knowledge and the computational methods used to assist in decision-making (e.g. Boolean and fuzzy logic, artificial neural networks, and decision trees, flowcharts, and tables).
- Biostatistics: Statistical reasoning methods in medicine (e.g. hypothesis testing, multivariate analysis).
- Databases in Medicine: Computer-based patient records and the standards for storage, retrieval, and electronic communication of medical data (e.g. DICOM, PACS, SNOMED)
- Case studies, recent advancements, future trends: These may include: Computers-assisted and robotic surgery, computer-aided diagnosis, tele-medicine, biometrics, radiotherapy, human modelling, security in medical information systems, micro-array data analysis, computers for drug design, and more.

Grading:
Grading to be announced during the first week of classes.

Handbook of Medical Informatics 1st Edition, J. Bemmel, M. Musen, Springer Verlag, 1997, 9783540633518, Copies available via amazon. There is a hard copy version available to be signed out on the SFU library

**Academic Honesty Statement:**

Academic honesty plays a key role in our efforts to maintain a high standard of academic excellence and integrity. Students are advised that ALL acts of intellectual dishonesty will be handled in accordance with the SFU Academic Honesty and Student Conduct Policies (http://www.sfu.ca/policies/gazette/student.html).
